

## **Patient information: Quitting smoking (The Basics)**

[Written by the doctors and editors at UpToDate](#)

**What are the benefits of quitting smoking?** — Quitting smoking can lower your chances of getting or dying from heart disease, lung disease, or cancer. It can also lower your chances of getting osteoporosis, and can help your skin look younger and reduce the chances that you will have problems with sex. Quitting smoking will improve your health no matter how old you are, and no matter how long or how much you have smoked.

**What should I do if I want to quit smoking?** — The word “START” can help you remember the steps to take:

**S** = Set a quit date.

**T** = Tell family, friends, and the people around you that you plan to quit.

**A** = Anticipate or plan ahead for the tough times you'll face while quitting.

**R** = Remove cigarettes and other tobacco products from your home, car, and work.

**T** = Talk to your doctor about getting help to quit.

**How can my doctor or nurse help?** — Your doctor or nurse can give you advice on the best way to quit and can put you in touch with counselors or other people you can call for support. Your doctor may also give you medicines to reduce your craving for cigarettes or reduce the unpleasant withdrawal symptoms that happen when you stop smoking.

You can also get help from a free phone line (1-800-QUIT-NOW) or go online to [www.smokefree.gov](http://www.smokefree.gov).

**What are the symptoms of withdrawal?** — The symptoms include trouble sleeping, being irritable, anxious or restless, getting frustrated or angry, having trouble thinking clearly. Some people who stop smoking become temporarily depressed. Some of them need treatment for depression, such as counseling or antidepressant medicines. If you get depressed when you quit smoking, tell your doctor or nurse about it.

**How do medicines help?** — Different medicines work in different ways:

- **Nicotine replacement therapy** eases withdrawal and reduces your body's craving for nicotine, the main drug found in cigarettes. Non-prescription forms of nicotine replacement include skin patches, lozenges, and gum. Prescription forms include nasal sprays and “puffers” or inhalers.
- [Bupropion](#) is a prescription medicine that reduces your desire to smoke. This medicine is sold under the brand names Zyban® and Wellbutrin®. It is also available in a generic version.
- [Varenicline](#) (brand name: Chantix®) is a prescription medicine that reduces withdrawal symptoms and cigarette cravings. If you think you'd like to take varenicline and you have a history of depression, anxiety, or heart disease, discuss this with your doctor or nurse before taking the medicine.

If you take [bupropion](#) or [varenicline](#) and you have any of the following symptoms, stop taking the medicine and call your doctor or nurse: become very nervous, become depressed, start to do strange things, think about killing yourself.

**How does counseling work?** — Counseling can happen during formal office visits or just over the phone. A counselor can help you figure out what triggers your smoking and what to do instead, overcome cravings, and figure out what went wrong when you tried to quit before.

**What works best?** — Studies show that people have the best luck if they take medicines to help them quit **and** work with a counselor. It might be helpful to combine nicotine replacement and one of the prescription meds that help people quit.

**Will I gain weight if I quit?** — Yes, you might gain a few pounds. But quitting smoking will have a much more positive effect on your health than weighing a few pounds more. Plus, you can help prevent some weight gain by being more active and eating less. Taking the medicine [bupropion](#) might help control weight gain.

**What else can I do to improve my chances of quitting?** — You can start exercising and stay away from smokers and places that you associate with smoking. If people close to you smoke, ask them to quit with you. Keep gum, hard candy, or something to put in your mouth handy. If you get a craving for a cigarette, try one of these instead. Don't give up, even if you start smoking again. It takes most people a few tries before they succeed.

**What if I am pregnant and I smoke?** — If you are pregnant, it's really important for the health of your baby that you quit. Ask your doctor what options you have, and what is safest for your baby.
